

# Building Energy Savings Projections

## For Efficiency Solution Providers

We model your solutions. You simulate their impact in any building, anywhere, in seconds.

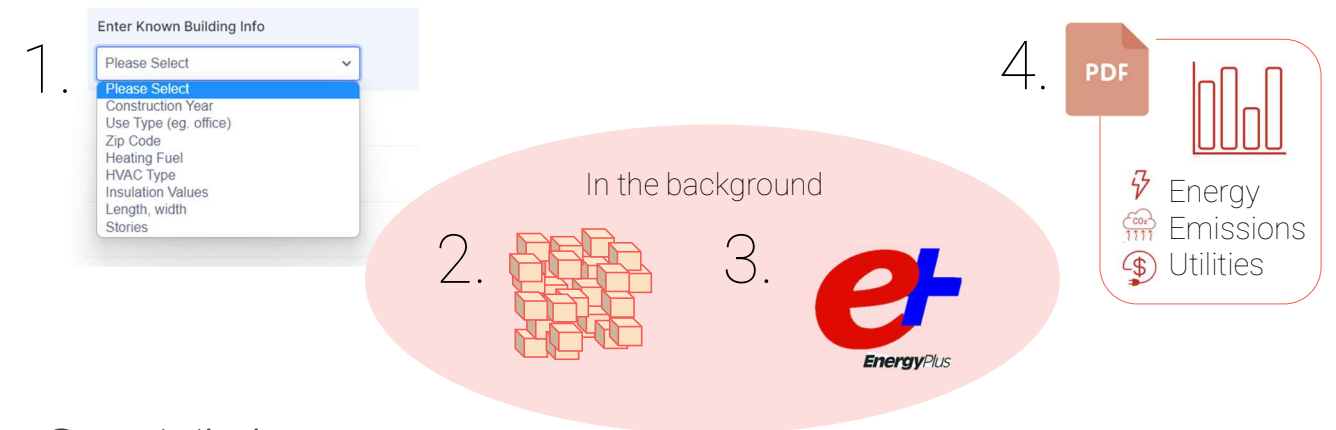

{YOUR PRODUCT} – Post Install Energy Savings

# From Building Info to Impact in Seconds

Our customized form-based tool is so simple that anyone without energy expertise can use it to simulate custom efficiency measures in a potential client's building. Here's how it works:

1. The user enters the known building information.
2. Using assumptions for anything unknown, a building energy model is automatically created. Assumptions are intelligent, considering building location, type, and age, and leverage recent DoE and EIA research on the U.S. building stock to increase accuracy.
3. The custom measure(s) are automatically applied, then their energy usage is simulated using the validated DoE engine EnergyPlus.
4. The user receives a client-ready report of the energy, cost, and CO2 impact of your solution(s) in their building.

## An Insightful Partnership

What value do we provide?

1. After a demo and a consultation to make sure your solution is right for eModeler, an energy model expert will develop a precise model of your specific technology or solution(s).
2. We'll incorporate this model into a no-expertise-required tool that allows you to easily calculate the expected savings of your solution(s) in any building.
3. We can also use the model to generate insights about your products. By leveraging DoE Commercial Reference Buildings, you'll be able to analyze how your solution performs across climates, building types, and ages.

## Our Vision

As energy consultants, the Emodeler team has been developing and using tools like this internally for years. With advances in automation and data availability for U.S. buildings, it's finally possible to share this ability.

We think it's important for professionals without energy expertise to have cheap and simple access to energy efficiency measure calculations. Why?

1. To remove the consultation barrier and get more retrofits completed
2. To help building owners make better informed decisions
3. To help providers leverage the strengths of their solutions
